01 Executive Summary

This report covers the period 31 Aug 2026 to 6 Sep 2026 (UTC). THE SIGNAL's automated collection captured 98 threat-feed articles across 9 monitored sources, 936 new CVE records from NVD, 7 deep-dive research write-ups, 175 ransomware victim postings, and 2 newly disclosed breaches.

936 new CVE records were published this week, including 259 rated Critical and 677 rated High severity (100% of the week's total). 3 are listed in CISA's Known Exploited Vulnerabilities (KEV) catalog, confirming active exploitation in the wild — these warrant immediate patching priority regardless of CVSS score. Google Chrome was the most represented vendor among this week's Critical/KEV disclosures (11 records). The most common weakness category was Improper Access Control, appearing in 72 records.

175 new ransomware victim postings were logged across 43 active groups, led by qilin (16 postings). 2 newly disclosed breaches were added to the tracker this week, together exposing approximately 10,075,866 records.

02 Threat Feed Overview

98 articles were captured across 9 sources this week, of which 35 were flagged Critical or High severity by keyword-based triage (36% of the week's total). The Hacker News was the most active source, contributing 25 articles.

Severity breakdown

SEVERITY	COUNT	% OF TOTAL
Critical	24	24%
High	11	11%
Medium	9	9%

03 Vulnerability Intelligence (CVE)

936 new CVE records were published this week, including 259 rated Critical and 677 rated High severity (100% of the week's total). 3 are listed in CISA's Known Exploited Vulnerabilities (KEV) catalog, confirming active exploitation in the wild — these warrant immediate patching priority regardless of CVSS score. Google Chrome was the most represented vendor among this week's Critical/KEV disclosures (11 records). The most common weakness category was Improper Access Control, appearing in 72 records.

Highlighted disclosures

CRITICAL CVSS 10.0 **KEV**

CVE-2026-83548

A Pre-authentication SSRF vulnerability exists in the SMA1000 Appliance Work Place interface due to an unintended alternate access path. A remote unauthenticated attacker could potentially exploit this vulnerability to g...

HIGH CVSS 8.8 **KEV**

CVE-2026-85046

Type confusion in V8 in Google Chrome prior to 152.0.7977.82 allowed a remote attacker to execute arbitrary code inside the sandbox via a crafted HTML page. (Chromium security severity: High)

HIGH CVSS 7.8 **KEV**

CVE-2026-83549

Post-authentication Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') vulnerability has been identified in the SMA1000 Appliance Management Console (AMC) which in specific conditi...

06 Methodology & Sources

This report is generated automatically by THE SIGNAL's data pipeline from the sources below, with no independent analyst review of individual findings:

-
- **Threat Feed** — RSS from The Hacker News, Krebs on Security, BleepingComputer, Dark Reading, SecurityWeek, The Record, SANS ISC, Microsoft Security Blog, Unit 42, and NCSC UK. Severity is a keyword-based heuristic, not a scored assessment.
 - **CVE Detail** — NVD CVE API 2.0, cross-referenced against CISA's Known Exploited Vulnerabilities (KEV) catalog. Only Critical/High severity records, plus any KEV-listed CVE regardless of score, are retained.
 - **Research Detail** — The DFIR Report, Securelist, Elastic Security Labs, SentinelOne Labs, and Check Point Research.
 - **Ransomware** — leak-site postings tracked via ransomware.live.
 - **Breaches** — Have I Been Pwned.

Detail tables in this report are capped for length where a dataset's weekly volume is large; each section links to the corresponding live page on THE SIGNAL for the complete, current archive.

07 Report Versioning

This report format is under active development and is expected to change between editions — new sections, refined statistics, and better attribution as the underlying data pipeline improves. This edition was generated using **template v1.2**.

VERSION	DATE	NOTES
v1.2	2026-09-08	Every page of the PDF now has a real, colored top/bottom margin — including where a table or paragraph continues right after a page break, not just the first page — via a blank (no title, no page numbers) header/footer used solely to paint that space; report files renamed to a descriptive the-signal-weekly-report-<week> pattern instead of the bare ISO week code. Fixed a real stats bug: breakdown tables (sources, CWEs, vendors, categories, ransomware groups) now disclose "+N more" when capped at their top-8 display instead of silently truncating, after one shipped with a total that didn't reconcile. Ransomware victim postings are no longer linked (their source is a Tor .onion address, unsuitable for this report). The full report layout is now also published as its own HTML page, not just as a PDF-conversion input.
v1.1	2026-09-08	PDF is now a purpose-built print document (cover page, table of contents, numbered sections, real data tables with repeating headers, narrative analysis paragraphs) rendered from its own layout, not a screenshot of the web-view report — full-bleed dark theme to every page edge. Web-view dashboard panels no longer truncate long category/vendor names.
v1.0	2026-09-08	Initial report format: executive summary, dashboard view, and detail sections for CVEs, research articles, notable feed items, and ransomware/breach activity.
